

REDLab Product Security Newsletter

Cohesity REDLab is a dedicated team of security experts who perform in-depth research and rigorous malware testing inside a fully isolated environment. Within REDLab, live malware is executed to rigorously stress test Cohesity solutions for assessing resilience against real-world cyber threats. This process enhances our understanding of malware techniques and tactics, and in turn, helps us build products that are more effective in data protection and security. The insights gained also provide valuable guidance to customer security and data protection teams.

This newsletter provides monthly updates on the most impactful ransomware strains evaluated in REDLab, along with comprehensive findings concerning detection and recovery procedures.

Cohesity DataProtect and NetBackup in REDLab

REDLab incorporates both Cohesity DataProtect and Cohesity NetBackup products to enable extensive testing against malware and sophisticated cyberattacks. Through live malware execution, advanced exploit simulation, and modern attack techniques, REDLab examines the effectiveness of Cohesity's solutions. The air-gapped nature of REDLab ensures comprehensive threat assessment under controlled conditions.

- **Proven Confidence:** Backup and recovery solutions undergo rigorous testing against active, high-level cyber threats, not just theoretical threats or synthetic data.
- **Hardened Defense:** Testing in REDLab evaluates the security capabilities of DataProtect and NetBackup offer strong security capabilities. Positive results elevate the products beyond simple backup and recovery scenarios defence.
- **Forward-Looking:** REDLab continually broadens its testing scope in response to evolving threats. Further, REDLab uses the latest product innovations in advanced threat protection and threat hunting to benchmark performance against real-world threats.

REDLab Findings

During this month, a series of malware listed below were intentionally detonated to evaluate product efficacy of Cohesity DataProtect and NetBackup.

Strain Details	Hash / IOC
Name: Absolute Domination Family: Absolute Domination Group	<u>73e7290e2ff078283df8604817101904d1526895410314a505e2eeea43d215ce</u>

Malware impact post execution

Absolute Domination surfaced in 2026 as a compact but aggressive ransomware strain built as a .NET Framework 4.7.2 (C#) PE32+ assembly rather than the Rust/native tooling seen in many modern families, signalling low-effort but effective "smash-and-grab" tradecraft. It recursively enumerates user directories and encrypts documents and media using AES (AesManaged) with PBKDF2-derived keys, appending a distinctive .dominated extension, and gates decryption behind a Windows Forms "locker" GUI password prompt while exfiltrating victim data via the Telegram Bot API. Before encrypting, it dismantles defenses disabling Windows Defender real-time, behavior and on-access monitoring, stopping AV services (WinDefend, wscsvc), and disabling Task Manager. It inhibits recovery through bcdedit commands and mass file overwrite/deletion and poisons the hosts file to null-route security and telemetry domains.

Image: VM crash (BSOD) with stop code `CRITICAL_PROCESS_DIED`, observed post attack.

Outcomes

Both DataProtect and NetBackup completed successful VMware backup and recovery tasks following the attack. DataProtect VMware backup operations remained unaffected throughout. NetBackup's Image Entropy anomaly detection actively identified unusual deviation in VMware backup job attributes, demonstrating that its threat detection capabilities worked as designed. VMware based backup and recovery was successful for both products.

Threat Hunting Results

Following the ransomware attack, Rapid Threat Hunt was leveraged to proactively search for malicious activity using known SHA-256 hash and IOC associated with the Absolute Domination ransomware. The hunt successfully identified impacted clusters, objects, and file artifacts within the environment, providing clear visibility into the scope of compromise.

The screenshot displays the Cohesity Security Center interface, specifically the 'Rapid Threat Hunt' section. The left sidebar shows navigation options like 'Apps', 'Home', 'DataProtect', and 'Security Center'. The main panel is titled 'Rapid Threat Hunt' and includes a 'Search Hashes' section with a search bar containing the hash '73e7290e2ff078283df8604817101904d1526895410314a505e2eeea43d215ce'. Below the search bar, there are filters for 'File Modification Time', 'Hash Source', and 'System'. The 'Search Results' section shows a table with columns: File Name, File Hash Value, Object Name, Hash Source, and GTI Assessment. The results table shows one entry: 'absolute_domination.exe' with a file hash value of '73e7290e2ff078283df860481...', object name '/rndlab/datahawk/nfs/vol1', hash source 'Search Input', and a 'Malicious' assessment with a score of 80/100.

This capability enables security teams to quickly pivot from detection to investigation, validate threat presence, and assess potential blast radius across protected workloads.

UNC Ransomware

Note: Above table contains a curated subset of techniques prioritized for monitoring and response.*

Malware impact post execution

UNC ransomware is a recently observed ransomware variant belonging to the long-running Dharma (Crysis) ransomware family. After execution, it encrypts files on local systems and network-accessible shares, appending a distinctive ".UNC" extension together with a victim ID and attacker contact email (for example, ".id-XXXXXXX[cyberuncle@cyberfear.com].UNC"). It drops a ransom note and creates an "info.txt" file instructing victims to contact the operators via email for decryption. The malware employs classic double-extortion tactics, claiming that sensitive data has been stolen and threatening public disclosure if the ransom is not paid. Consistent with other Dharma variants, UNC disables or weakens system defenses, deletes Volume Shadow Copies to hinder recovery, and establishes persistence by copying itself into the %LOCALAPPDATA% directory and creating Windows Run registry entries. Its combination of file encryption, data-theft threats, recovery inhibition, and persistence mechanisms makes UNC a representative example of modern Dharma-based ransomware operations.

Image: UNC's ransom note (pop-up message)

Outcomes

Both DataProtect and NetBackup completed successful VMware backup and recovery tasks following the attack. DataProtect VMware backup operations remained unaffected throughout. NetBackup's Image Entropy anomaly detection actively identified unusual deviations in VMware backup job attributes, demonstrating that its threat detection capabilities worked as designed. VMware based backup and recovery was successful for both products.

Threat Hunting Results

Following the ransomware attack, Rapid Threat Hunt was leveraged to proactively search for malicious activity using known SHA-256 hash and IOC associated with the UNC ransomware. The hunt successfully identified impacted clusters, objects, and file artifacts within the environment, providing clear visibility into the scope of compromise.

The screenshot displays the Cohesity Security Center interface, specifically the 'Rapid Threat Hunt' section. The left sidebar shows navigation options like Apps, Home, DataProtect, Security Center, and various security tools. The main panel is titled 'Rapid Threat Hunt' and includes tabs for Hash-Ready, Snapshots, Snapshot Window, and Unique Hashes. A 'Search Hashes' section allows users to search for IOCs or unique file instances using SHA-256 hashes or threat feeds. Below this, there are checkboxes for various hash sources: CISA (458 Hashes), Cohesity REDLab (497 Hashes), Google Threat Intelligence (4000 Hashes), Open Source (499 Hashes), and Custom File Hashes (3095 Hashes). A search bar contains the hash 'a2b997da39d37f8eb43947b4632cd2ae1886e434b8cc65ff8501d79080ab5f29'. The 'Search Results' section shows a summary: 1 of 2 Scanned Clusters, 1 Affected Clusters, 1 Files Matched, 1 Hashes Matched, 1 Affected Objects, and 9s Completion Time. Below the summary, there are filters for File Modification Time, Hash Source, and System. The results table lists the following information:

File Name	File Hash Value	Object Name	Hash Source	GTI Assessment
unc.exe	a2b997da39d37f8eb43947b4...	/rmdlab/datahawk/nfs/vol1	Search Input	Malicious 80/100

This capability enables security teams to quickly pivot from detection to investigation, validate threat presence, and assess potential blast radius across protected workloads.

End Ransomware

Note: Above table contains a curated subset of techniques prioritized for monitoring and response.*

Malware impact post execution

END is a native C/C++ 64-bit Windows ransomware behaving as a MedusaLocker-lineage variant that favours fast, high-coverage encryption over stealth. Post-execution it enumerates local, removable, and network volumes and encrypts files using a hybrid AES + RSA CryptoAPI scheme, using intermittent ("crypt-and-skip") encryption and a system-file skip-list to accelerate impact while keeping the host bootable. Every affected file is renamed with the .end11 extension, and a HOW_TO_RECOVER_DATA.html ransom note is dropped into every traversed directory with localised variants across dozens of language folders.

Image: Desktop wallpaper updated post attack, displaying attacker contact information.

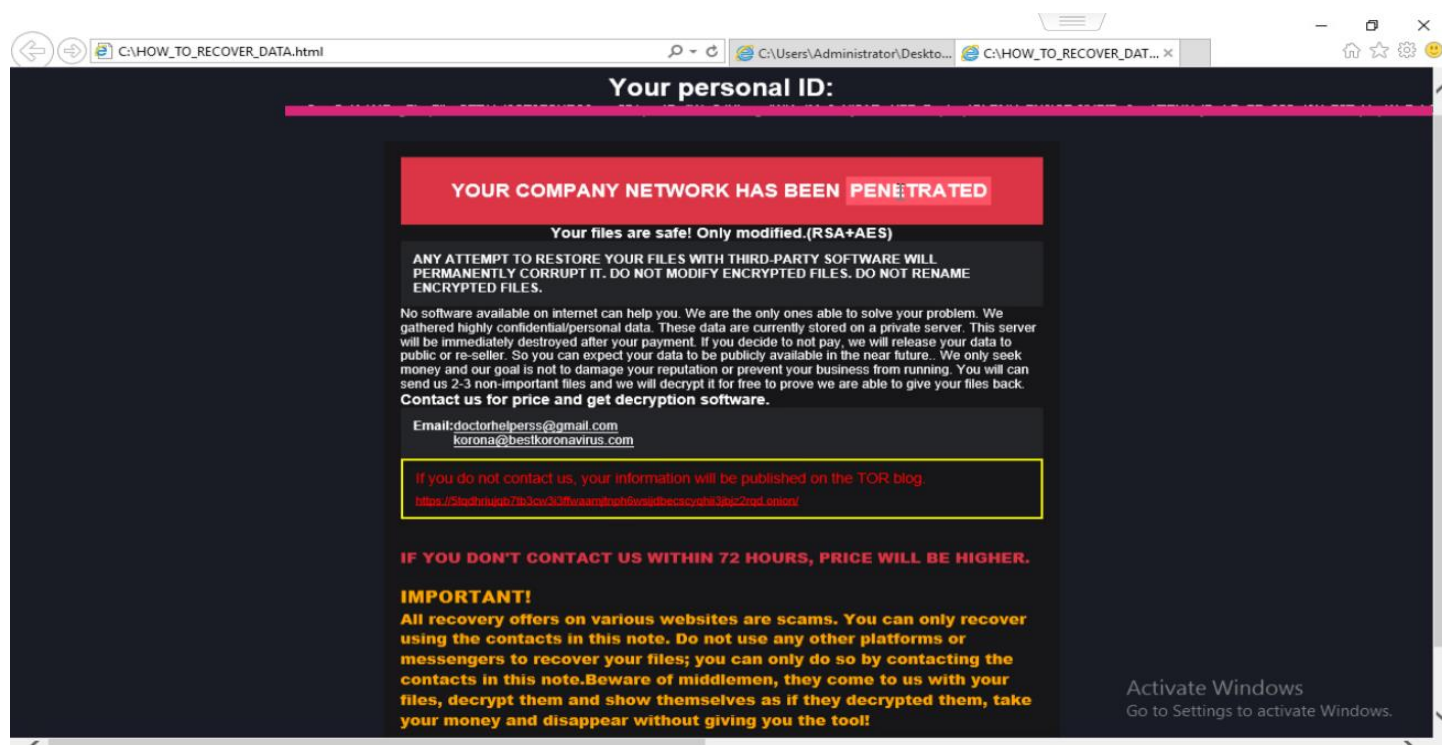

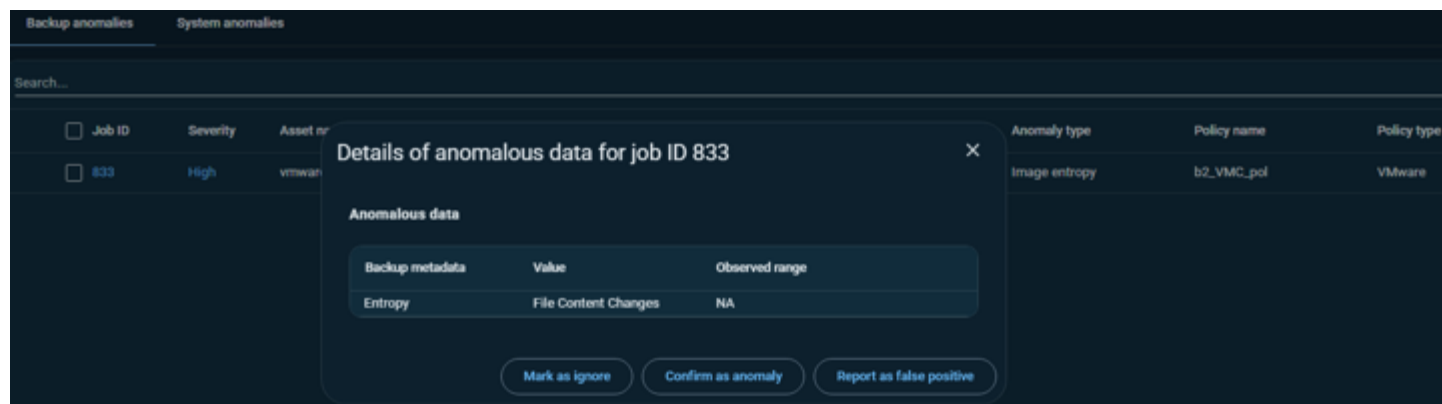

Image: Ransom Note named “HOW_TO_RECOVER_DATA.html” dropped along with recovery details.

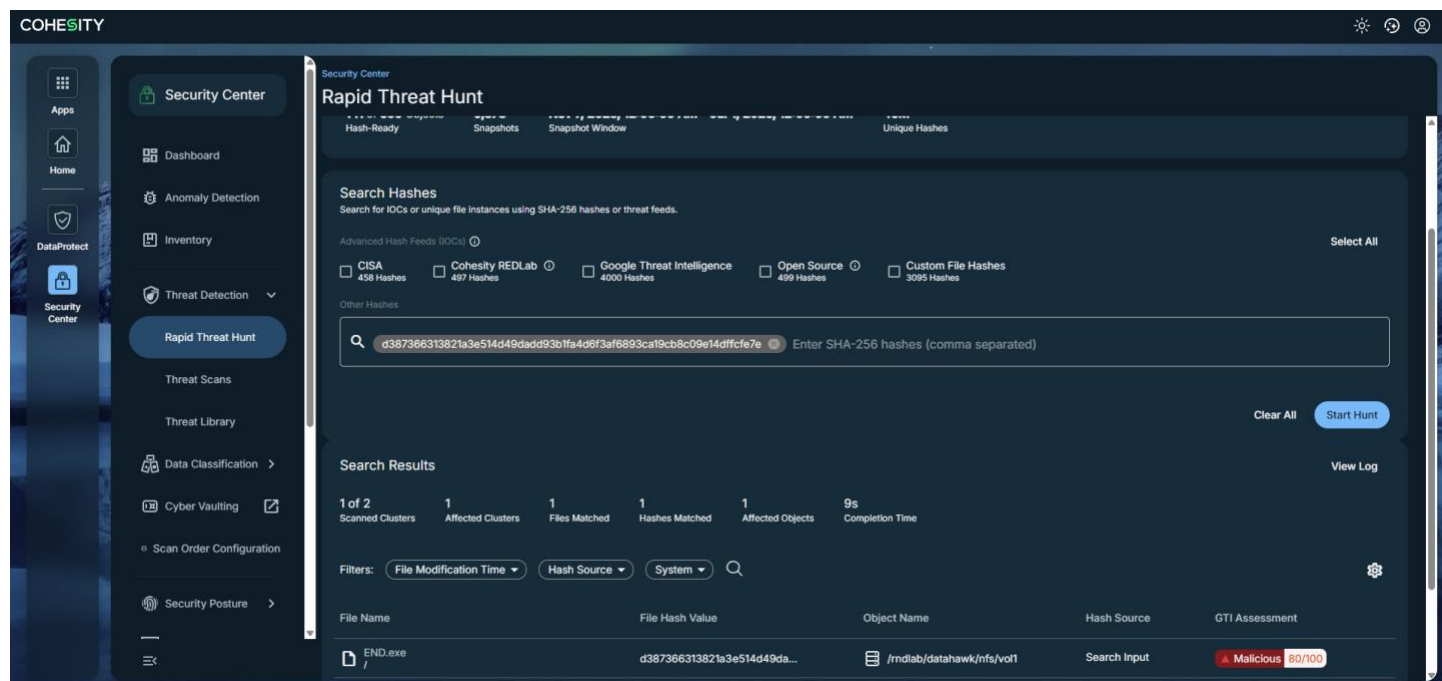

Outcomes

Both DataProtect and NetBackup completed successful VMware backup and recovery tasks following the attack. DataProtect VMware backup operations remained unaffected throughout. NetBackup's Image Entropy anomaly detection actively identified unusual deviation in VMware backup job attributes demonstrating its threat detection capabilities working as designed. VMware based backup and recovery was successful for both products.

Threat Hunting Results

Following the ransomware attack, Rapid Threat Hunt was leveraged to proactively search for malicious activity using known SHA-256 hash and IOC associated with the End ransomware. The hunt successfully identified impacted clusters, objects, and file artifacts within the environment, providing clear visibility into the scope of compromise.

This capability enables security teams to quickly pivot from detection to investigation, validate threat presence, and assess potential blast radius across protected workloads.

0Apt_Locker Ransomware

Note: Above table contains a curated subset of techniques prioritized for monitoring and response.*

Malware impact post execution

0apt Locker is a Rust-built 64-bit Windows ransomware (~5.8 MB, with a leaked /home/kali/.cargo/build path suggesting Linux-based development) that uses a robust hybrid encryption scheme. On execution it recursively walks the filesystem and encrypts files in parallel via a rayon thread pool for speed, applying AES (with AES-NI acceleration) to file contents and wrapping the keys with RSA-OAEP, making recovery infeasible without the attacker's private key. Encrypted files are renamed with the .0apt extension, and a ransom note named README0apt.txt is dropped across affected directories, directing victims to a Tor chat portal and applying double-extortion pressure by threatening to report them to agencies and regulators. It also overwrites the desktop wallpaper, enforces single-instance execution via a mutex, beacons over WinSock for command-and-control, and runs anti-VM, hardware-ID profiling, and anti-debug checks before detonation.

Image: Ransom Note named "README0apt.txt" dropped along with recovery details.

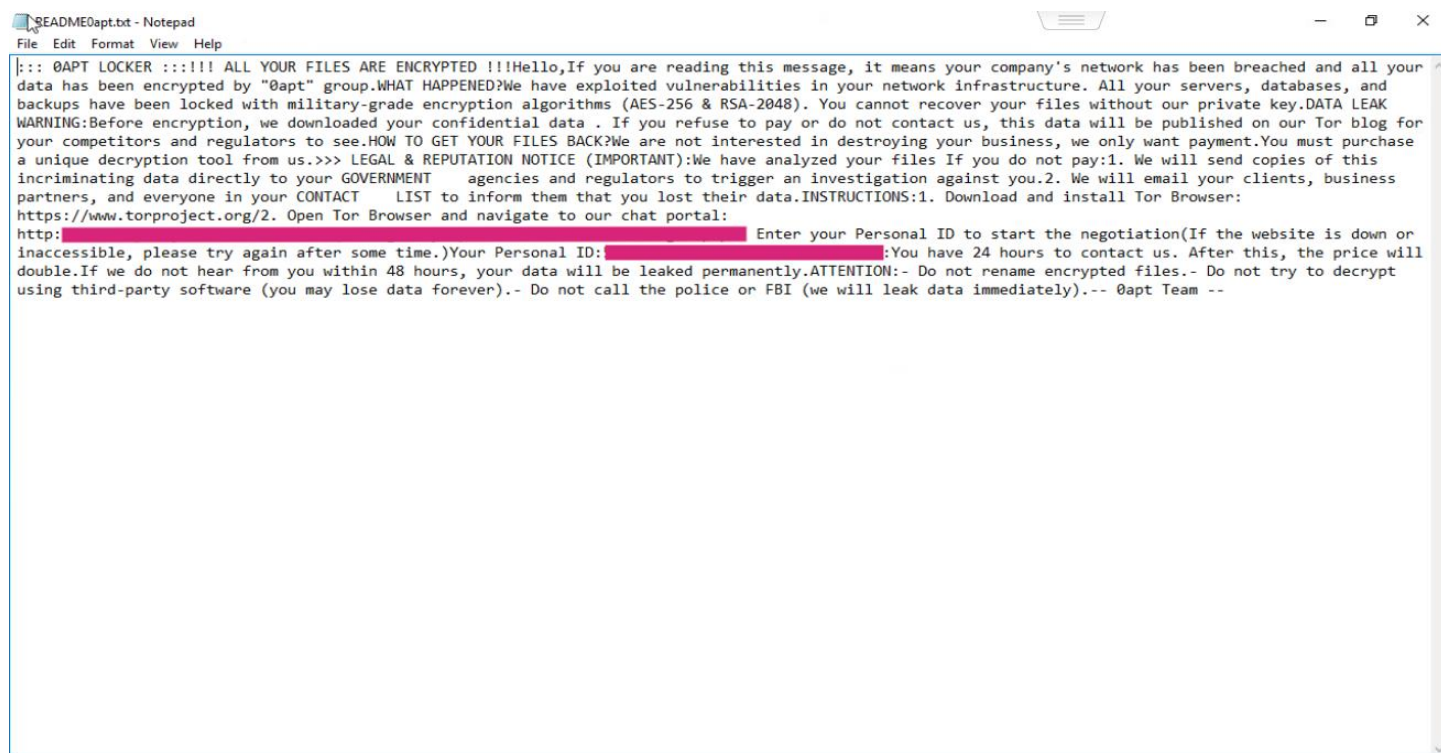

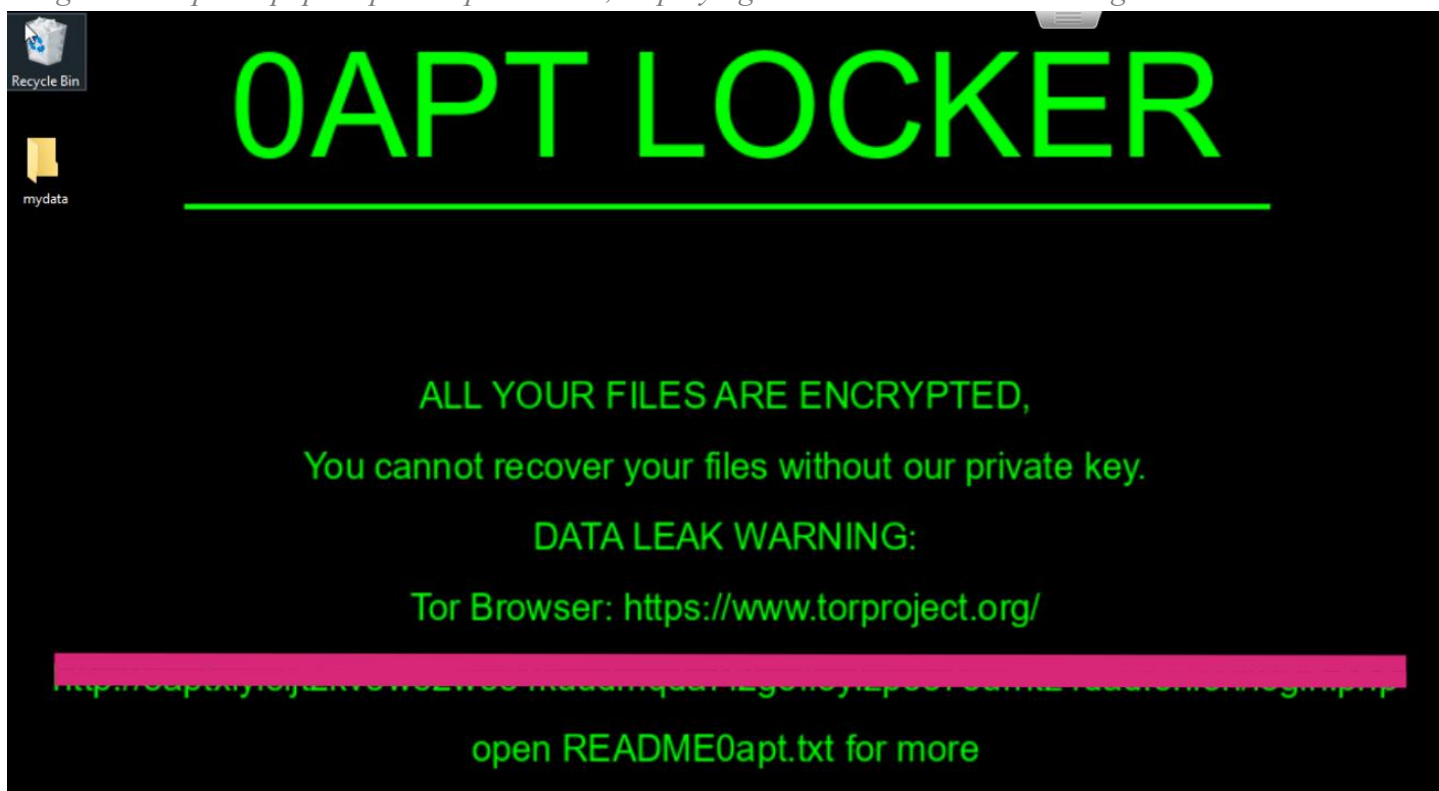

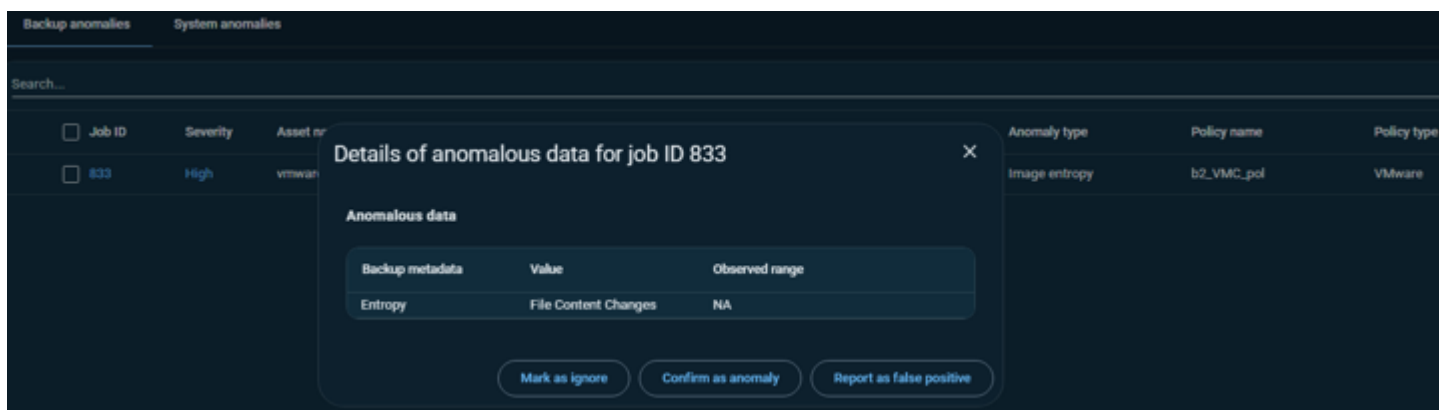

Image: Desktop wallpaper updated post attack, displaying “0APT LOCKER” branding.

Outcomes

Both DataProtect and NetBackup delivered successful VMware backup and recovery following the attack. DataProtect VMware backup operations remained unaffected throughout. NetBackup's Image Entropy anomaly detection actively identified unusual deviation in VMware backup job attributes demonstrating its threat detection capabilities working as designed. VMware based backup and recovery was successful for both products.

Threat Hunting Results

Following the ransomware attack, Rapid Threat Hunt was leveraged to proactively search for malicious activity using known SHA-256 hash and IOC associated with the 0Apt_Locker ransomware. The hunt successfully identified impacted clusters, objects, and file artifacts within the environment, providing clear visibility into the scope of compromise.

This capability enables security teams to quickly pivot from detection to investigation, validate threat presence, and assess potential blast radius across protected workloads.

Summary

- Both DataProtect and NetBackup completed VMware backup and recovery job successfully across all four ransomware strains tested - Absolute Domination, UNC, End and 0Apt_Locker, demonstrating the reliability of Cohesity's solutions under real-world attack conditions.
- DataProtect VMware backup operations remained unaffected throughout all tests, validating the platform's ability to maintain data protection under adverse conditions.
- NetBackup's Image Entropy anomaly detection proactively identified unusual deviations in VMware backup job attributes across all four strains – confirming that its active threat detection capabilities work as designed. VMware-based backup and recovery was successful.
- Rapid Threat Hunt enabled proactive threat investigation by correlating known malicious SHA-256 hashes and IOCs against protected environments, successfully identifying impacted clusters, objects and file artifacts.
