

Automation Starts Here

Cohesity Enables Seamless Automation and Integrations

Key Benefits

- Boost agility by overcoming operational challenges
- Improve DevOps speed and efficiency
- Enable self-service operations

Simplicity In. Complexity Out.

The modern data center is complex. Organizations are relying on a myriad of solutions from multiple different vendors with different tools to orchestrate workflows. This leads to operational inefficiencies in managing and operating today's sprawling IT environment, spanning on-premises and the public cloud. The result: fragmentation, in every sense of the word. Not only is data siloed, but the workflows—and subsequent tools to manage them—are fragmented as well. Among other factors, management complexity arises principally from:

- A plethora of management tools and applications for backup and unstructured data
- Service-level agreements (SLAs) that are not updated to suit the needs of the organization
- Lack of self-service capabilities for key IT workflows
- A steep learning curve in managing key elements of infrastructure

Cohesity tackles backup, recovery, and data management complexities at a deep level, building integrations that solve operational challenges such as configuration management, SLA management, orchestration, and other workflows that help organizations run. All integrations—for today and tomorrow—are native and built using the Cohesity REST API as a foundation. Compared to bolt-on integrations from legacy products, native integrations solve this purpose: removing complexity and enabling simplicity.

API-Driven Architecture: Simplicity as a Foundation

Cohesity Helios is based on an API-driven architecture, valuing automation, consumable APIs, and self-service capabilities from the get-go. Organizations enjoy error-free consistency and self-service manageability that extends the capabilities of individual applications and enables IT to spend less time with management and more time on ambitious, value-oriented projects.

A well-designed, effective platform is built around simplicity and extensibility. It has these traits:

- Easy to manage
- Easy to extend
- Easy to integrate with

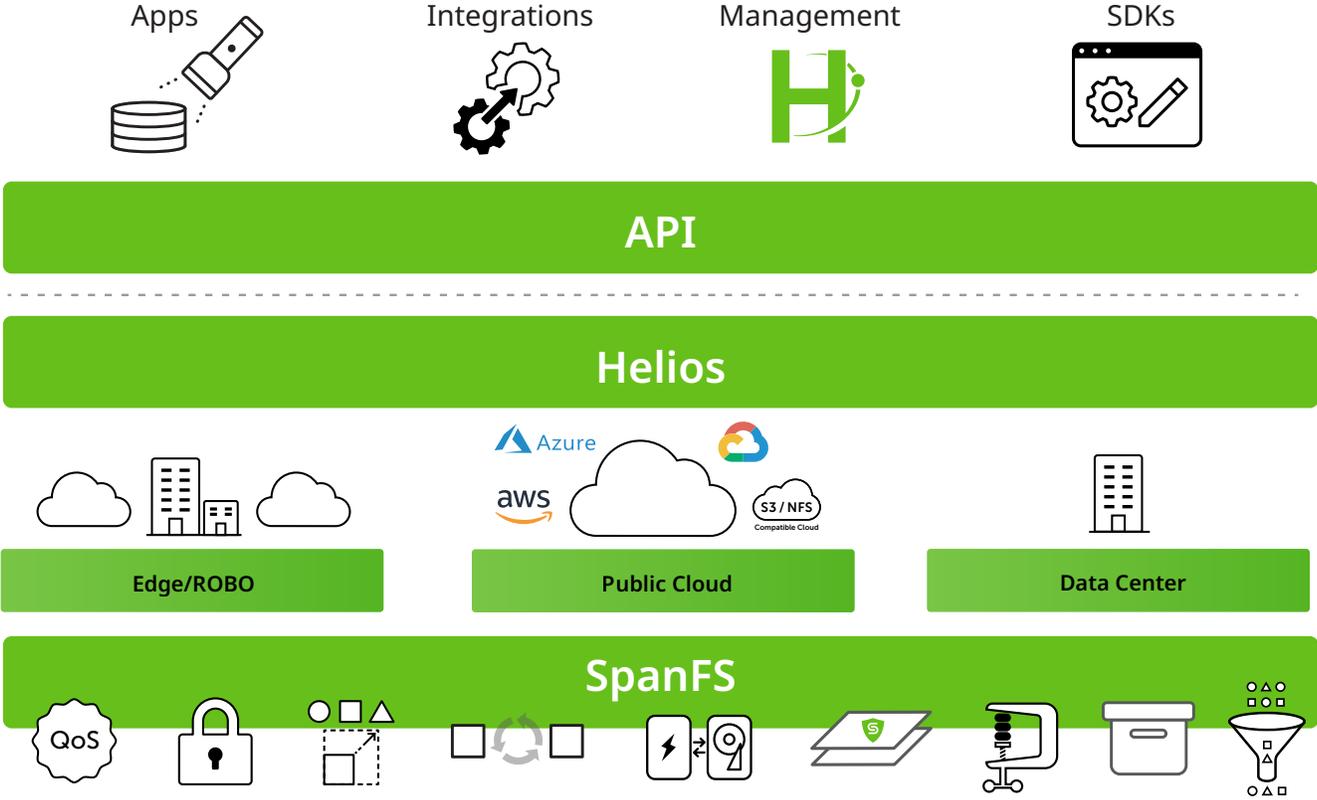

Figure 1: The Cohesity Data Management Platform Is Easy to Manage, Extend, and Integrate with Existing Enterprise Data Center and Cloud Solutions

Cohesity’s API-driven architecture puts the interests of the IT operator first. Core functions are viewed as the foundation of the system and can be extended to easily integrate with existing tools and environments.

Cohesity Helios has all three of the traits of a well-designed platform, making manageability, extendability, and integrability a part of the design process rather than an afterthought. Adhering to OpenAPI specifications and design principles, every interface, component, and integration is built on top of Cohesity’s REST API. Integrations, such as with ServiceNow and the VMware vRealize Suite, that help with operations management are built leveraging the Cohesity REST API.

Industry-Leading Integrations

Cohesity supports integrations with the tools teams already use. Numerous orchestration and automation tools are already supported including ServiceNow, Ansible, and vRealize Suite. As a corollary, homegrown, custom tools can be integrated with Cohesity Helios, allowing teams to rapidly adapt infrastructure to suit evolving business and IT needs.

Users across domains and industries have already reaped the benefits of Cohesity’s integrations, solving challenges from multi-tenant data protection to SLA management. Some of the top uses for seamless integrations include:

- **Self-service operations** with the vRealize Suite, ServiceNow, and custom portals
- **Configuration management** with Ansible and popular DevOps tools
- **SLA management and automation** with PowerShell and custom applications built with the Python SDK

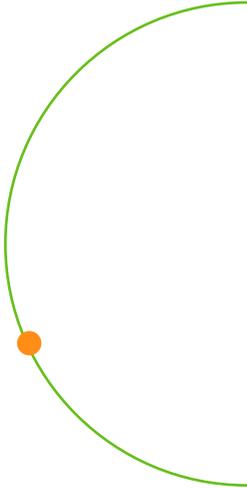

Enabling Agility, Speed, and Self Service

Through deep integrations with numerous infrastructure solutions and an API-driven architecture, Cohesity brings flexibility to infrastructure, allowing organizations to do more and address changing business needs.

For the modern organization, automation should not be an afterthought. Cohesity understands this and has built a platform to support data protection automation with any solution, seamlessly.
